Workshop

Gang-saw

Cut blocks into slabs according to client's required thickness, then first inspection, pick out unqualified slabs.

Tiles polishing

Polish each qualified slab by automatic polishing machine, then second inspection, classify these polished slabs in stock according to the standard established by company.

Tiles cutting

Factories are all equipped with CNC high-speed precision infrared cutting machine. Compared to traditional cutting machine, precision and efficiency have been highly improved so as to reduce the processing cost.

Special-shape processing

Supported by process line consisted of imported equipments such as CNC pneumatic line grinding machine, multi-function line grinding machine, computer coping machine and vertical lathe etc., we've achieved the standardized mass production of complicated special stone shapes and lines.

Dry-lay inspection

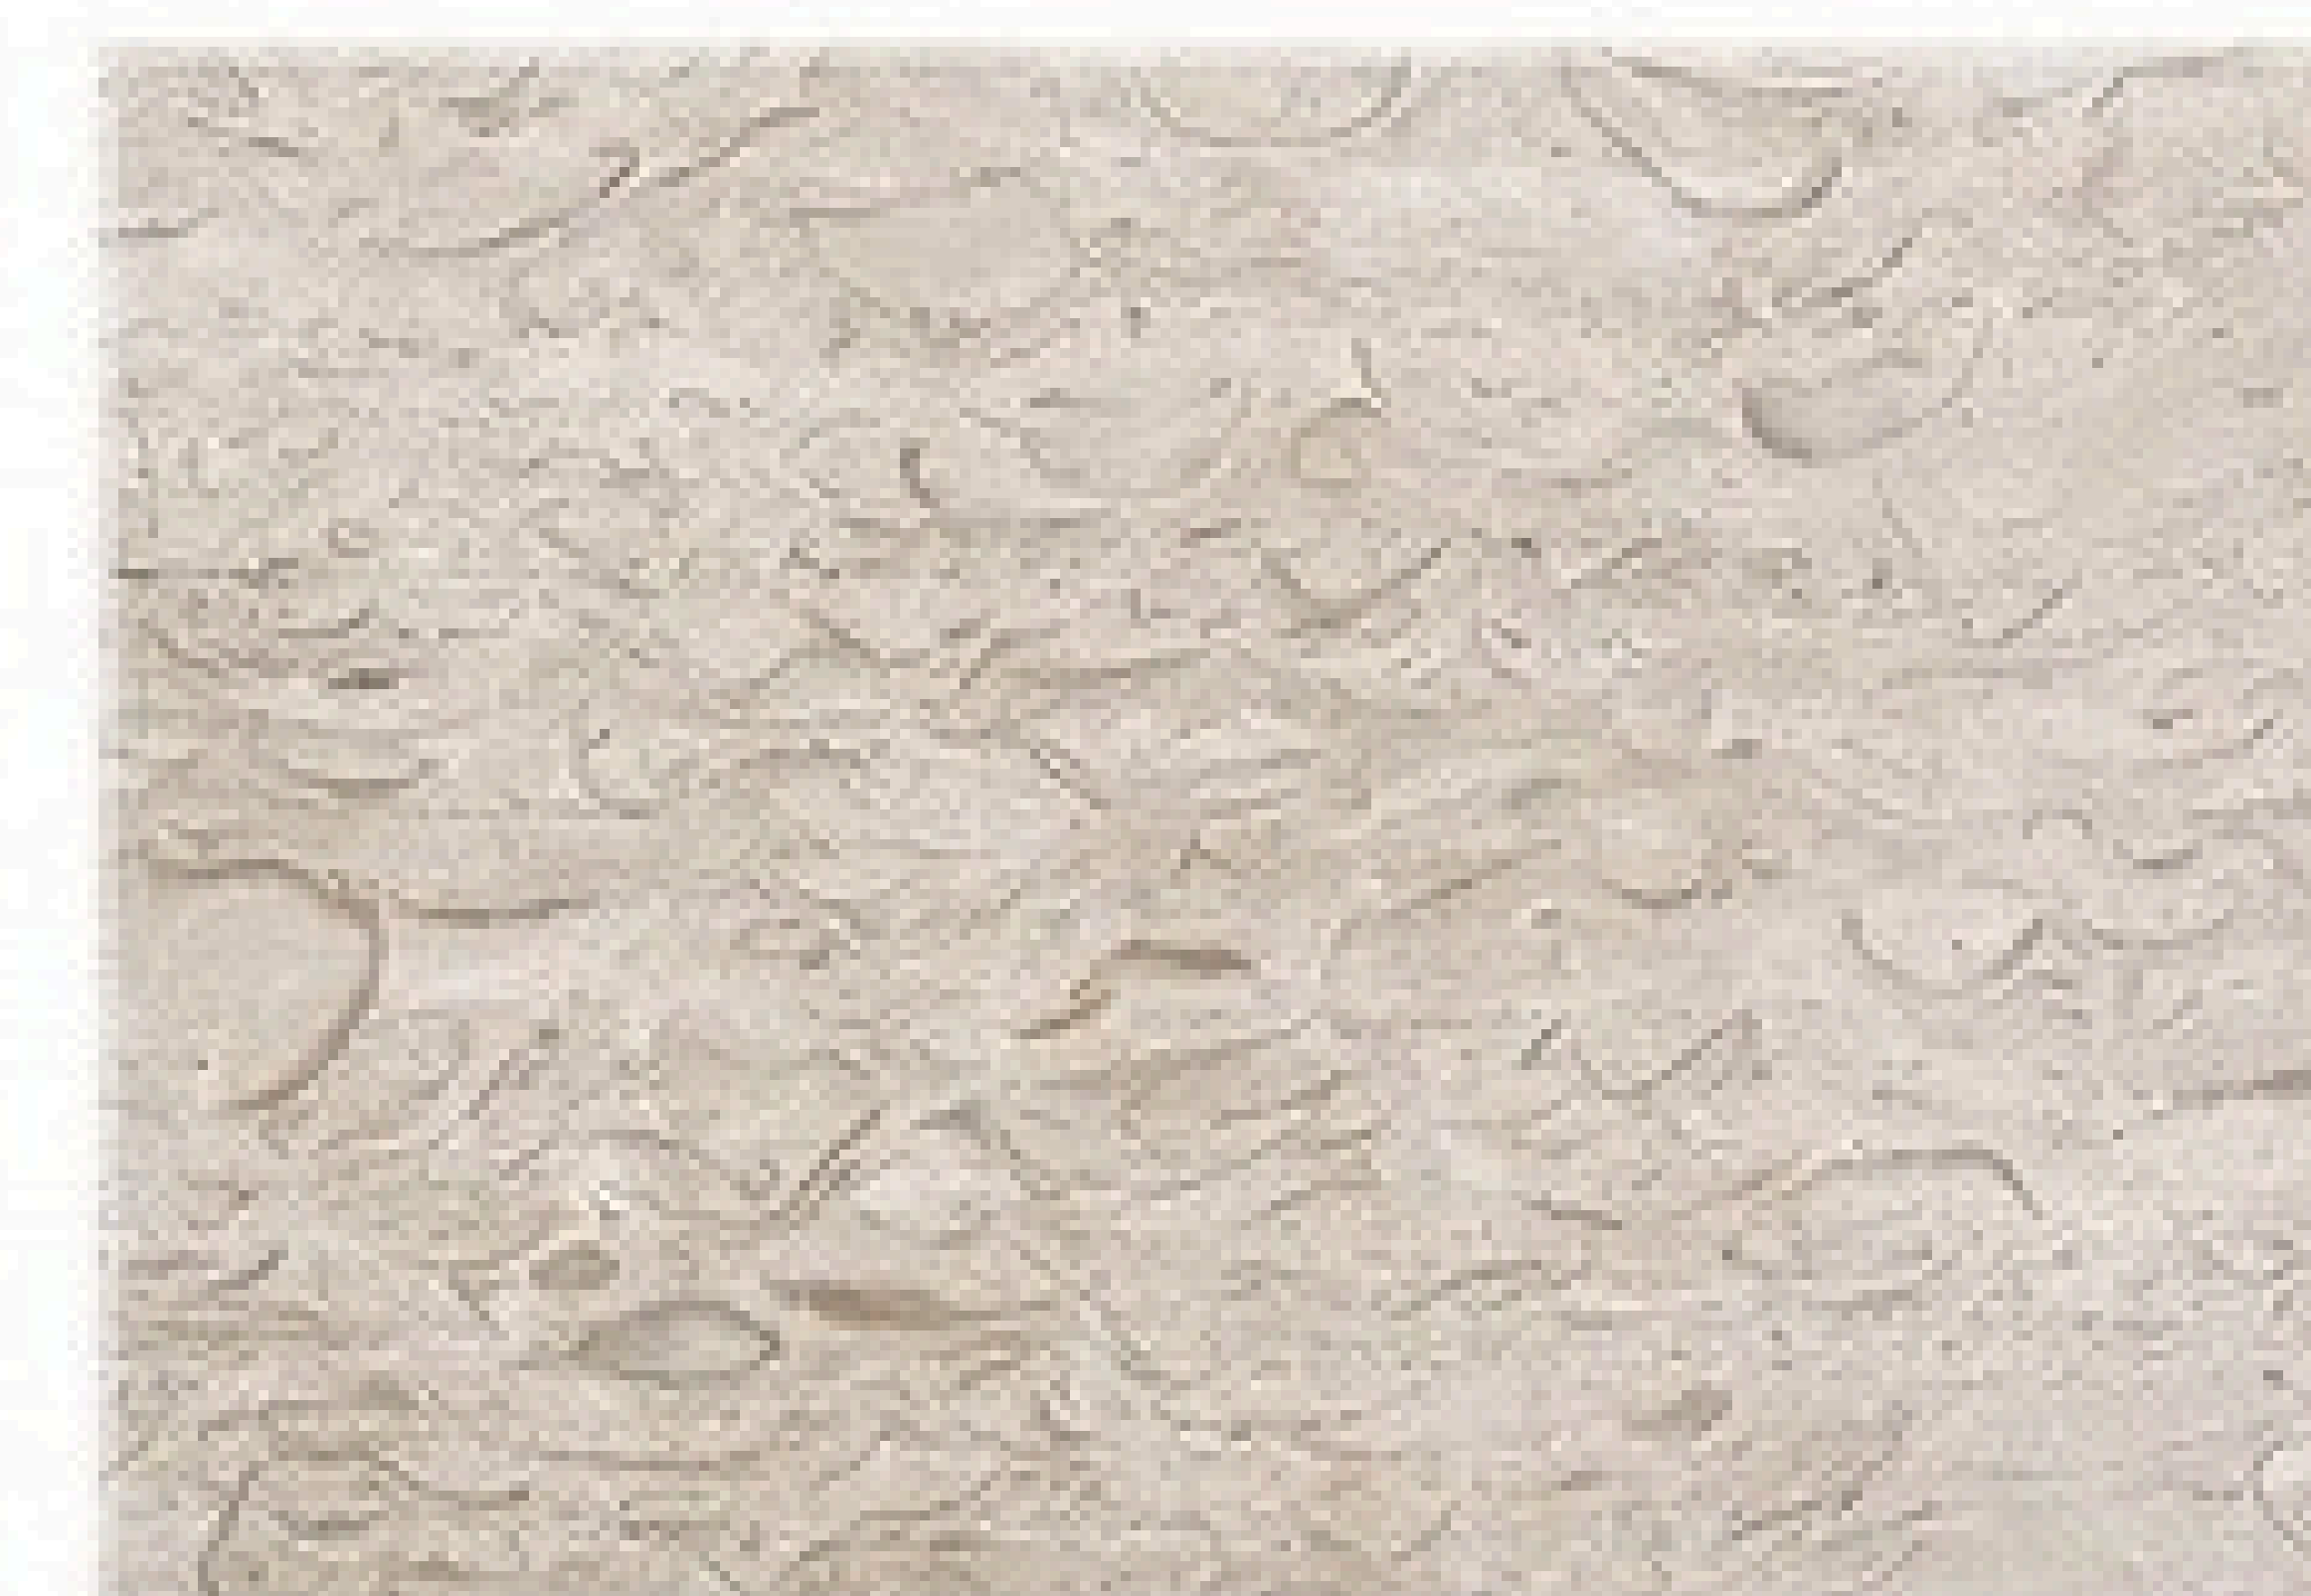

Lay out and examine finished products before packing. Pick out products which have defects in smoothness, flatness and appearance. Make sure the veins can be connected well and the colors are uniform before making construction drawings.

Packing

Pack the finished products according to client's requirements or the export standard of the specific country.

Composite Tile

The super-thin aluminum honeycomb laminated panels and the aluminum plastic laminated panels boast the following four major features:

1. Safety: the standard weights of the aluminum honeycomb laminated panels and the aluminum plastic laminated panels are only 1/5 of common stone panels, which greatly reduce the self-weight of buildings, and thus increase the safety of the decorations for internal and external walls of high-rises.

2. Energy Conservation & Environmental Protection: Especially for the aluminum honeycomb laminated panel owing to its special structure, the air inside aluminum honeycomb can efficiently decrease the heat conduction between indoor and outdoor, so as to achieve the effect of energy conservation. According to tests, its conductive coefficient is only 1/10 of common stone panels. What is more, the thickness of the product is only 3-6mm so that the utilization rate of stone is increased for three to four times and the natural resources are saved to large extent.

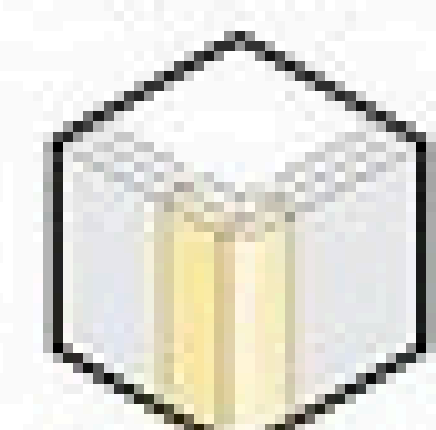

3. Outstanding performance: the test data from National Research Center of Testing Techniques for Building Materials reveal that all performance index of the super-thin stone panels overwhelm those of common stone panels (please see test reports for details).

4. Easy and convenient installation: we are able to provide different stone materials, products of different structures and forms according to customers' requirements, which can be applied to the decorations for both external and internal walls as well as ceilings. The materials and products are easy to be installed, which greatly speed up construction progress.
